CollabSpace

A dedicated space for creatives to organize assets, manage versions, collaborate, and deliver client-ready presentations.

Author:	**Titus Duncan**
Project webpage:	https://github.com/TitusDuncan/CollabSpace
Demo link:	https://iu.mediaspace.kaltura.com/media/t/1_3mhyeplm
System requirements:	Python 3 • Flask • SQLite • Runs locally in browser

Why CollabSpace exists

Creative work often gets scattered across tools, links, and shared folders. Files can be misplaced, overwritten, or corrupted, and teams lose track of which version is current. CollabSpace brings organization, version clarity, and client presentation into one place.

Who it's for

- Independent musicians and producers
- Visual artists and designers
- Small creative teams collaborating remotely
- Creators who need a clean way to deliver work to clients

Core features (current build)

Project workspace: Create projects to keep everything organized in one place.

Asset uploads (image/audio): Upload media with title, tags, and notes; preview directly in the app.

Version history + current: Add versions and set the current version so everyone knows what's latest.

Presentation pages: Publish a curated client page from selected assets/versions with a shareable link.

Business value

- Less time searching for files
- Fewer mistakes from wrong versions
- Cleaner client delivery and feedback loops

Roadmap (next steps)

Controlled access: Link validation rules, optional expiration, and permission enforcement.

Client review workflow: Approve version / request changes with notes and status updates.

Search improvements: Better filtering and quick retrieval across projects.

Future media: Video support later; WAV upload/playback postponed until final build.

Demo highlights

- UI inputs (forms) immediately create records in SQLite.
- Uploaded media is stored on disk and served back for preview.
- Version history stays intact while one “current version” remains clear.
- Presentation page displays selected versions with a shareable link.
