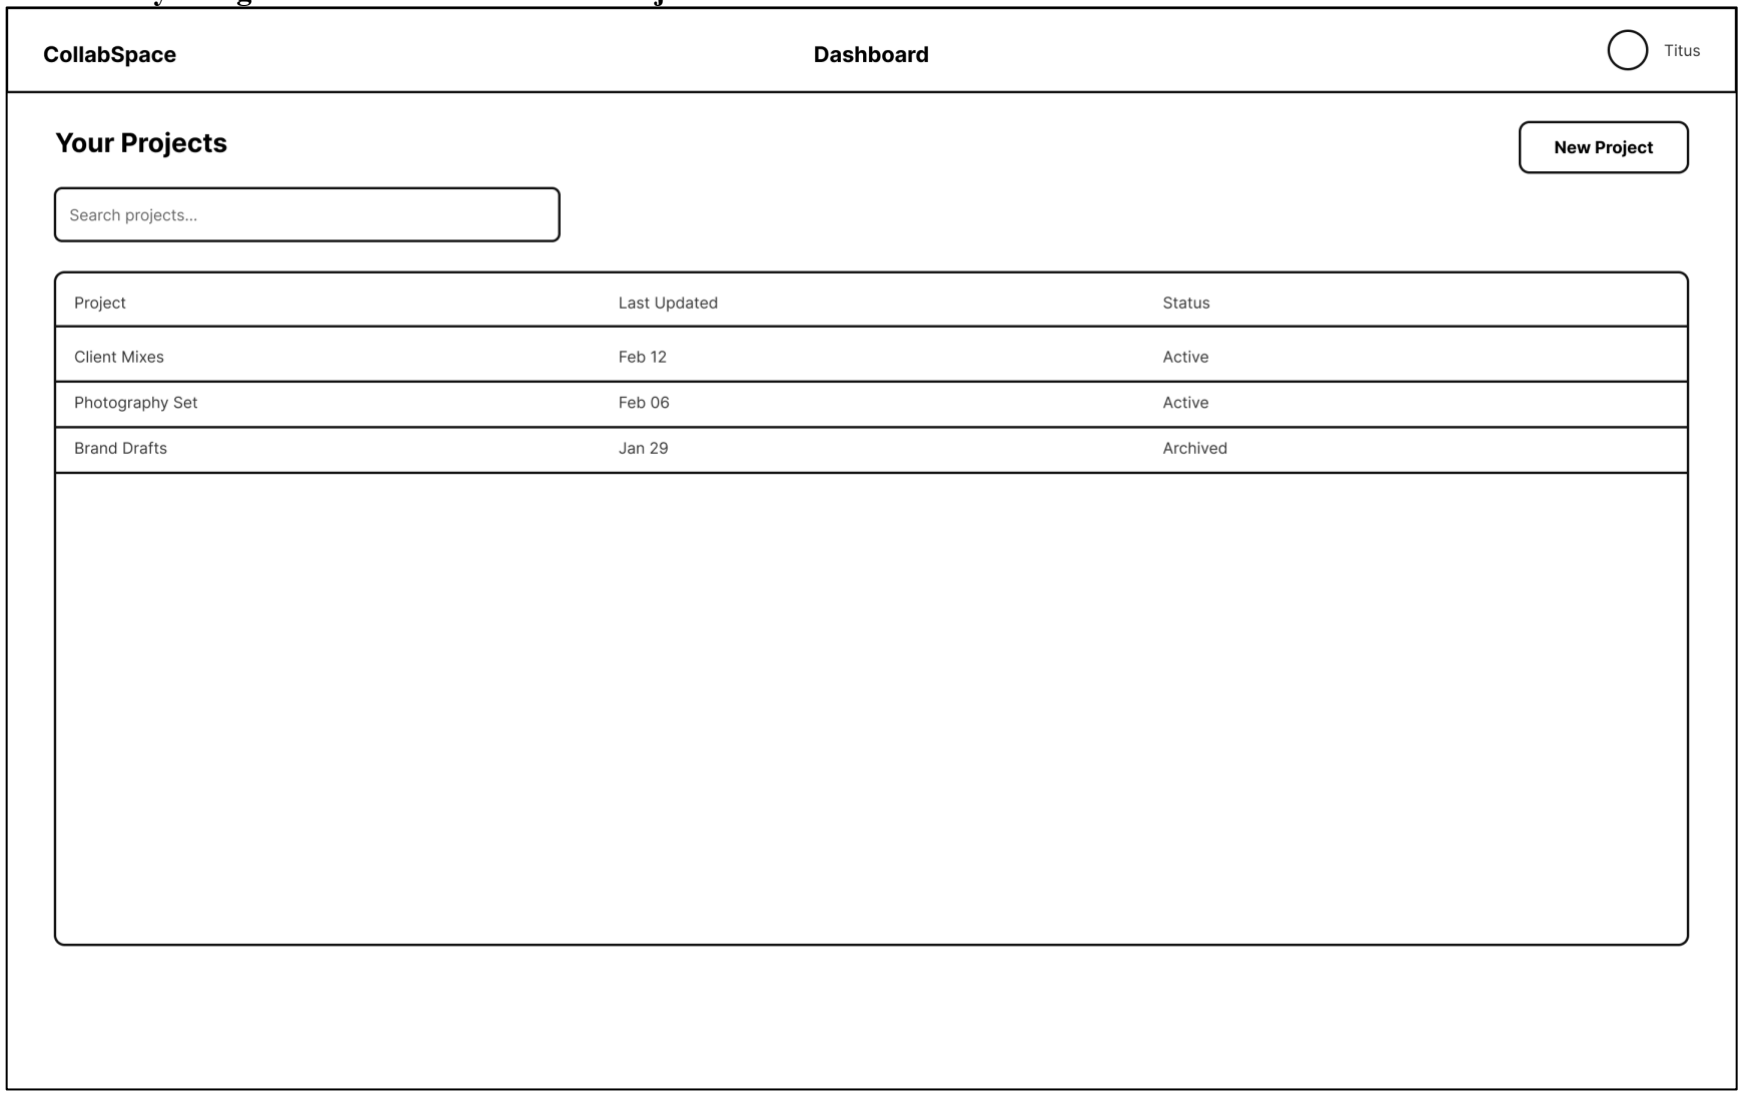
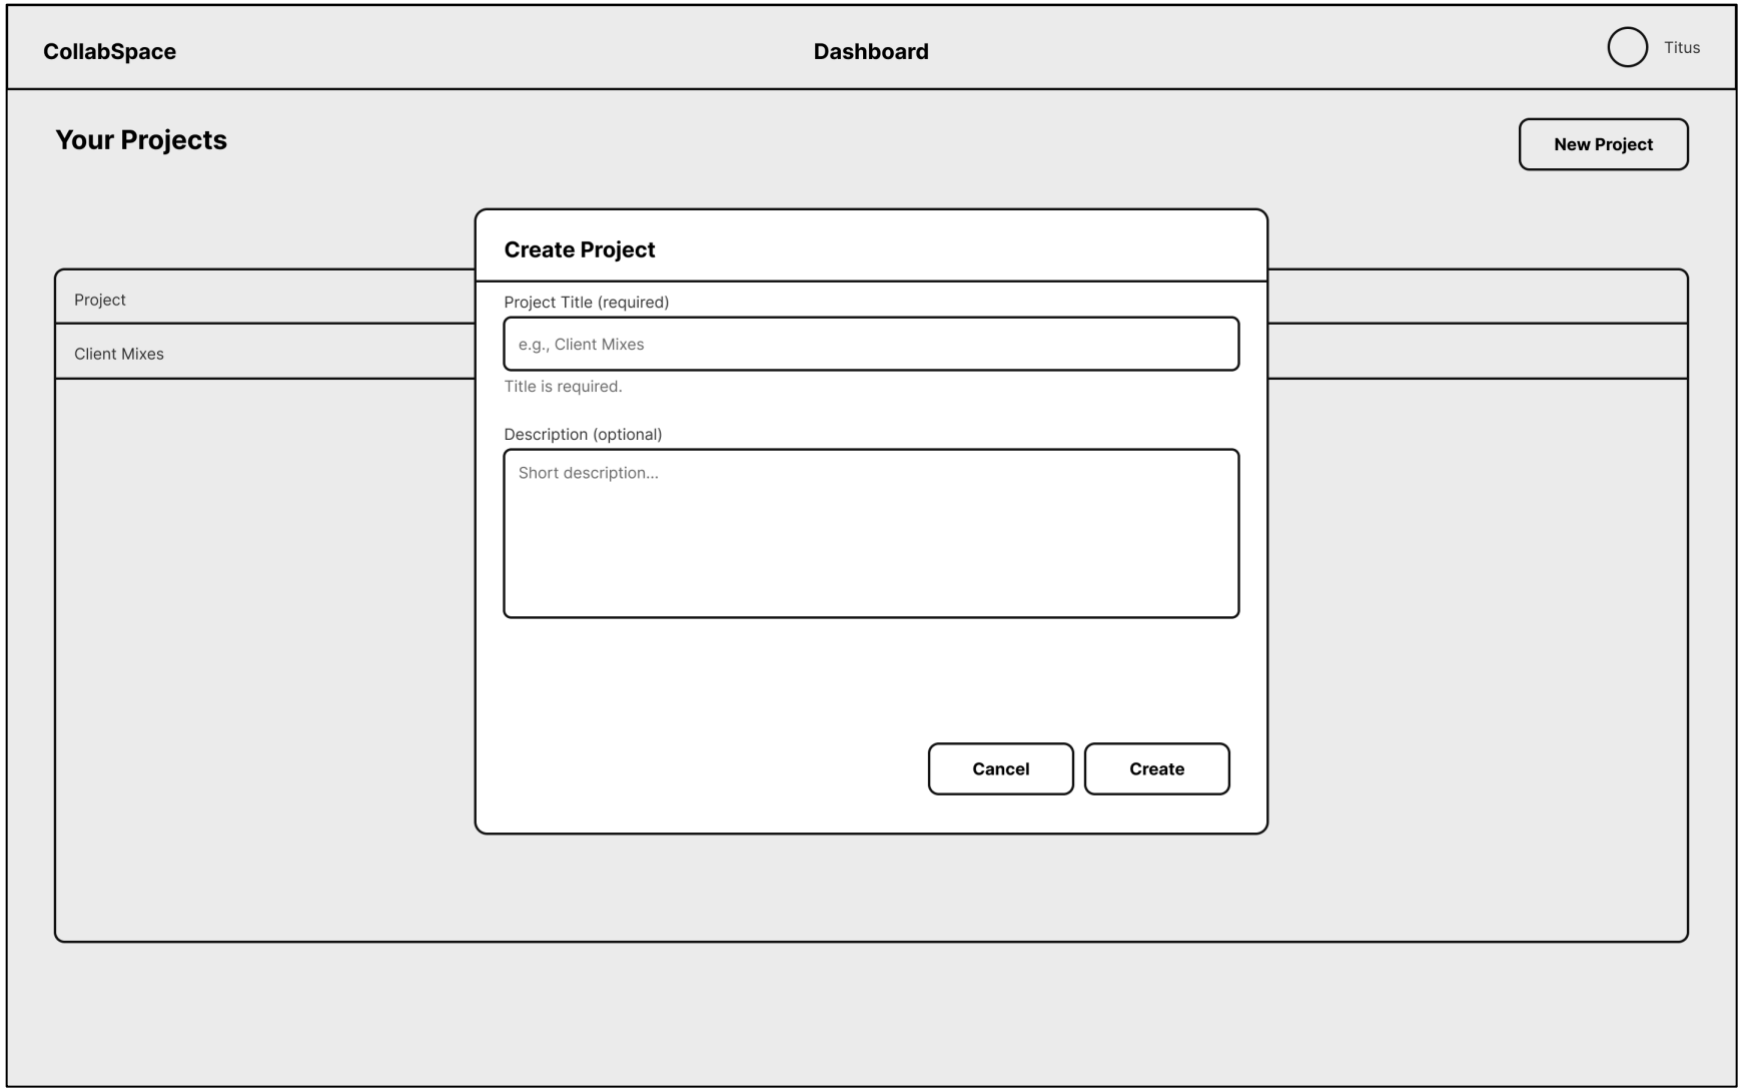
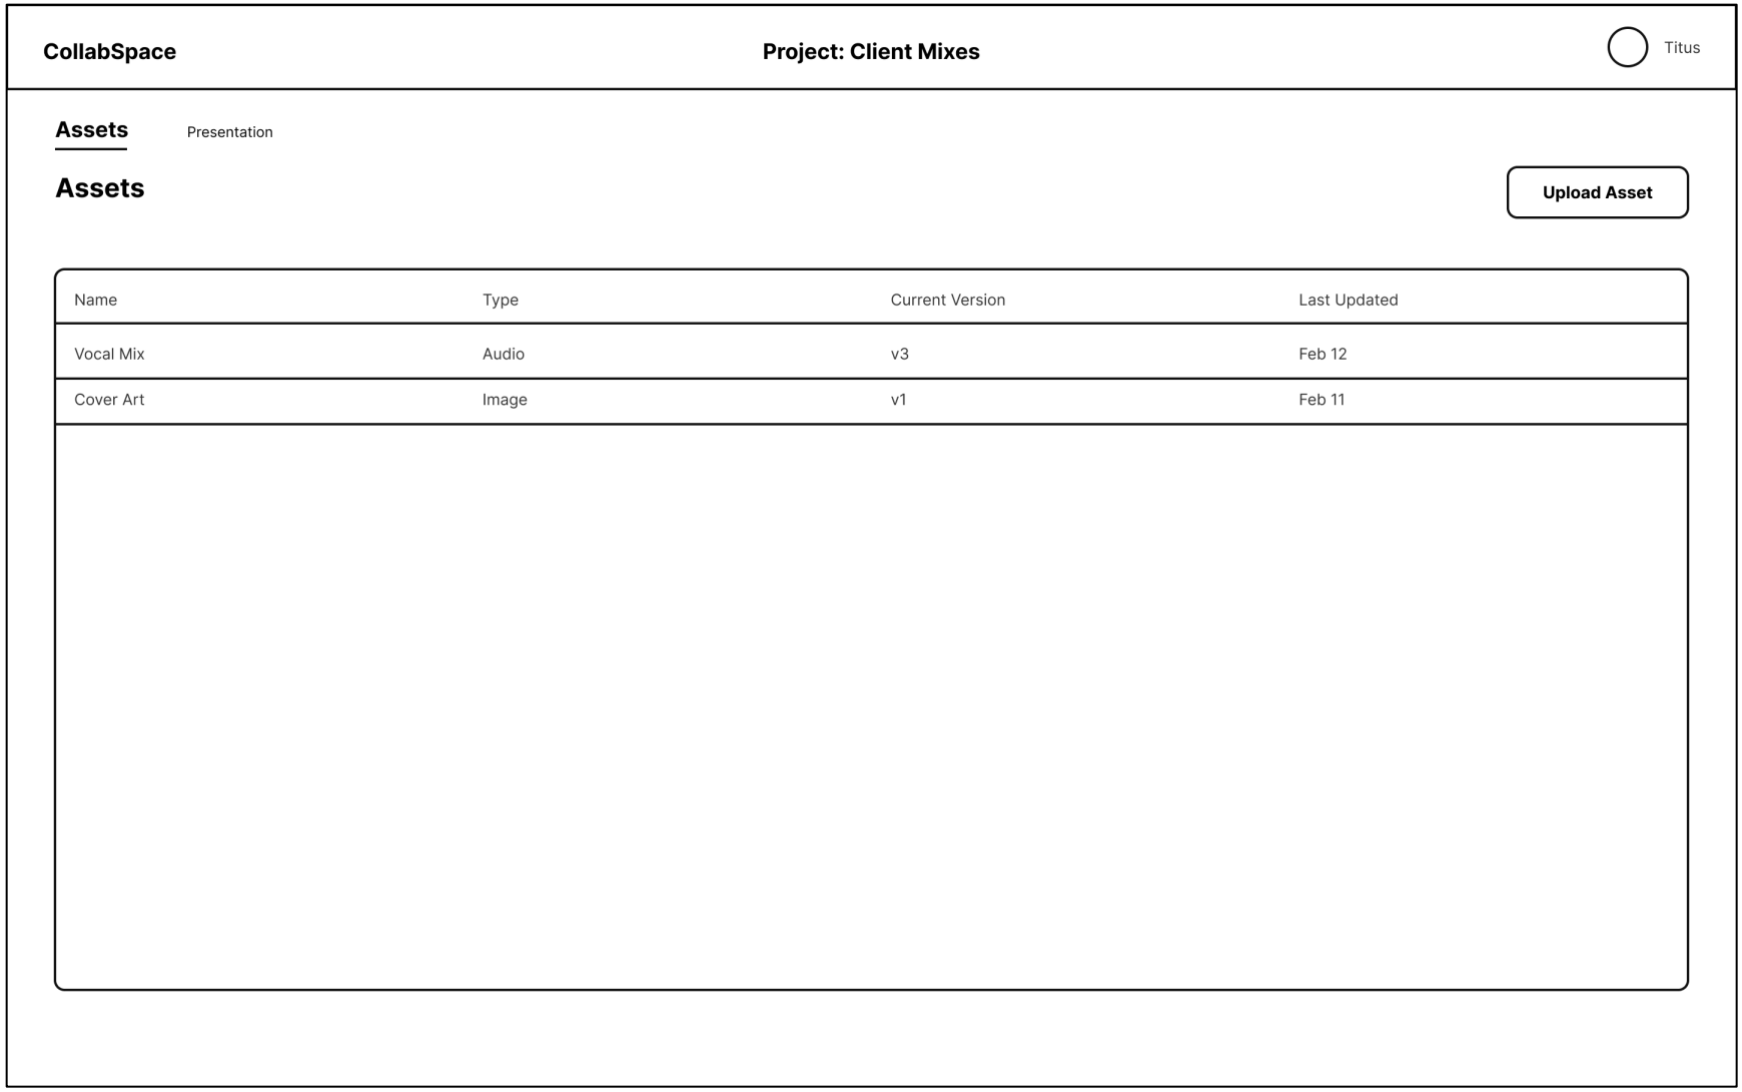
Preliminary Designs: Use Case 1 – Create a Project



Click **New Project.**

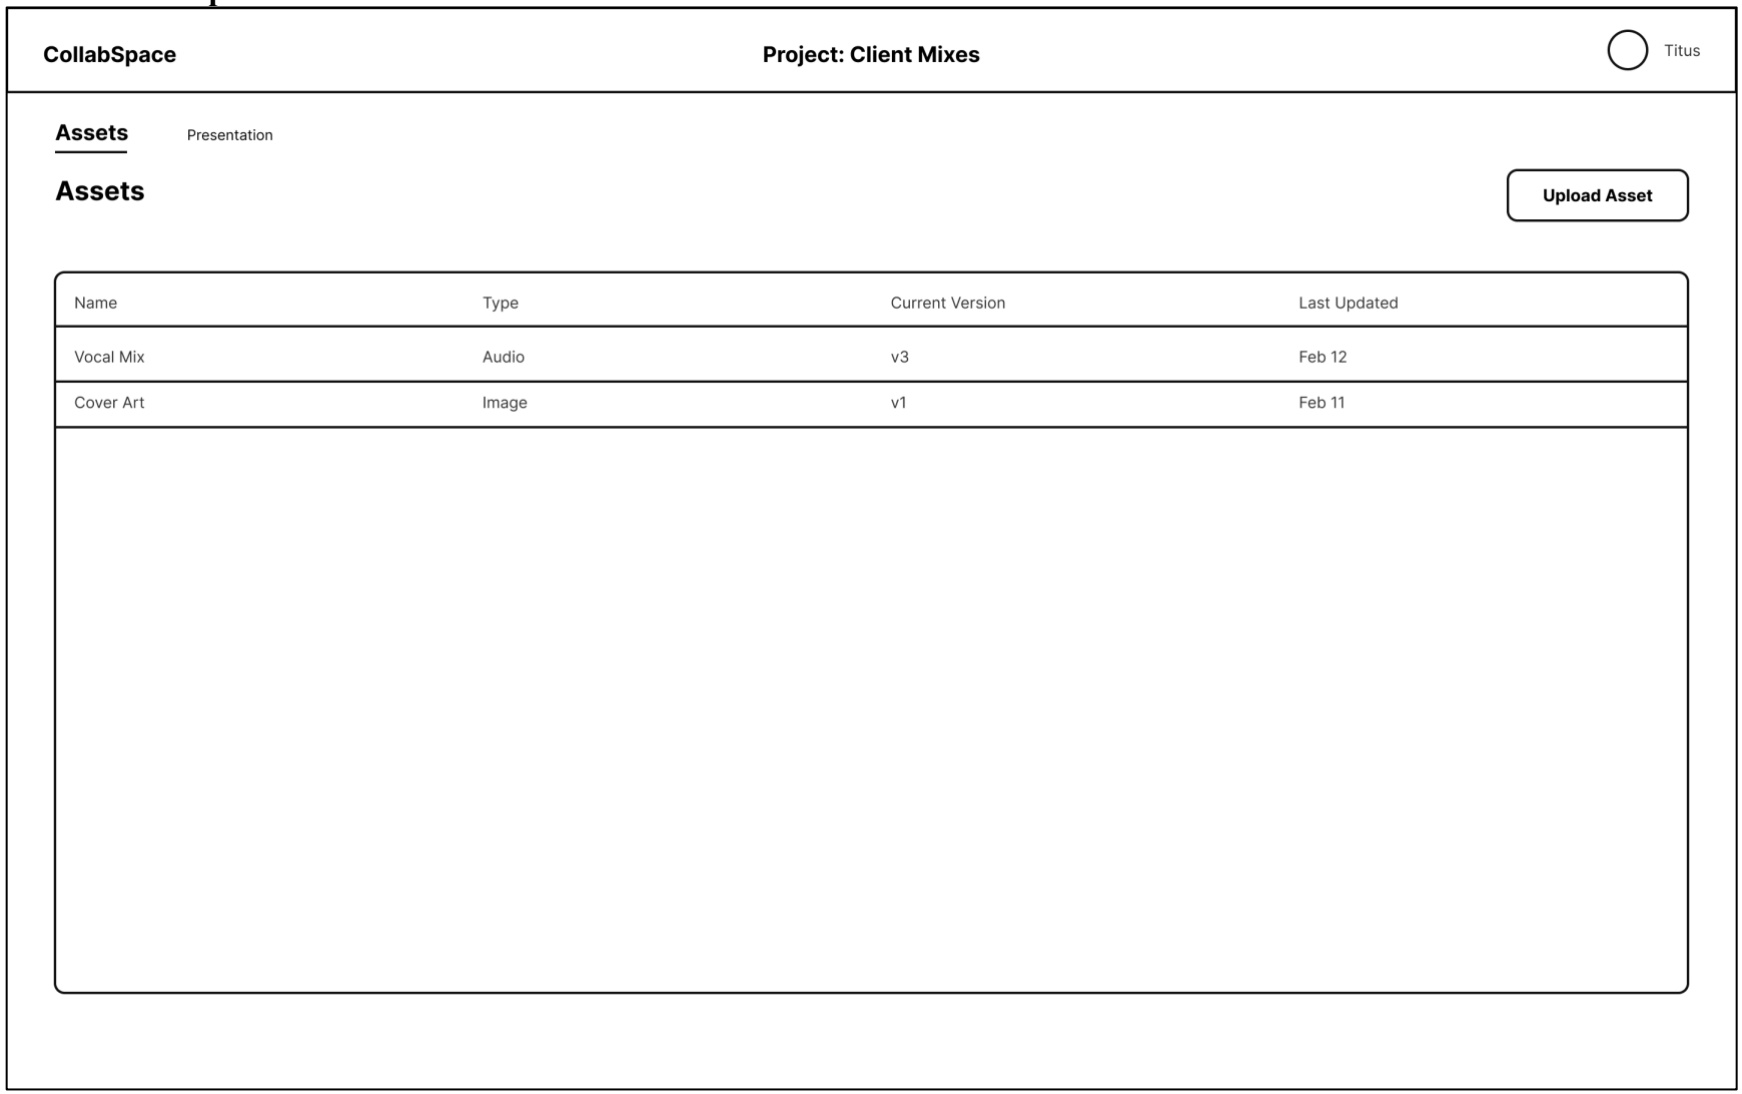


Type Project Title Name (description is optional) then click **Create.**



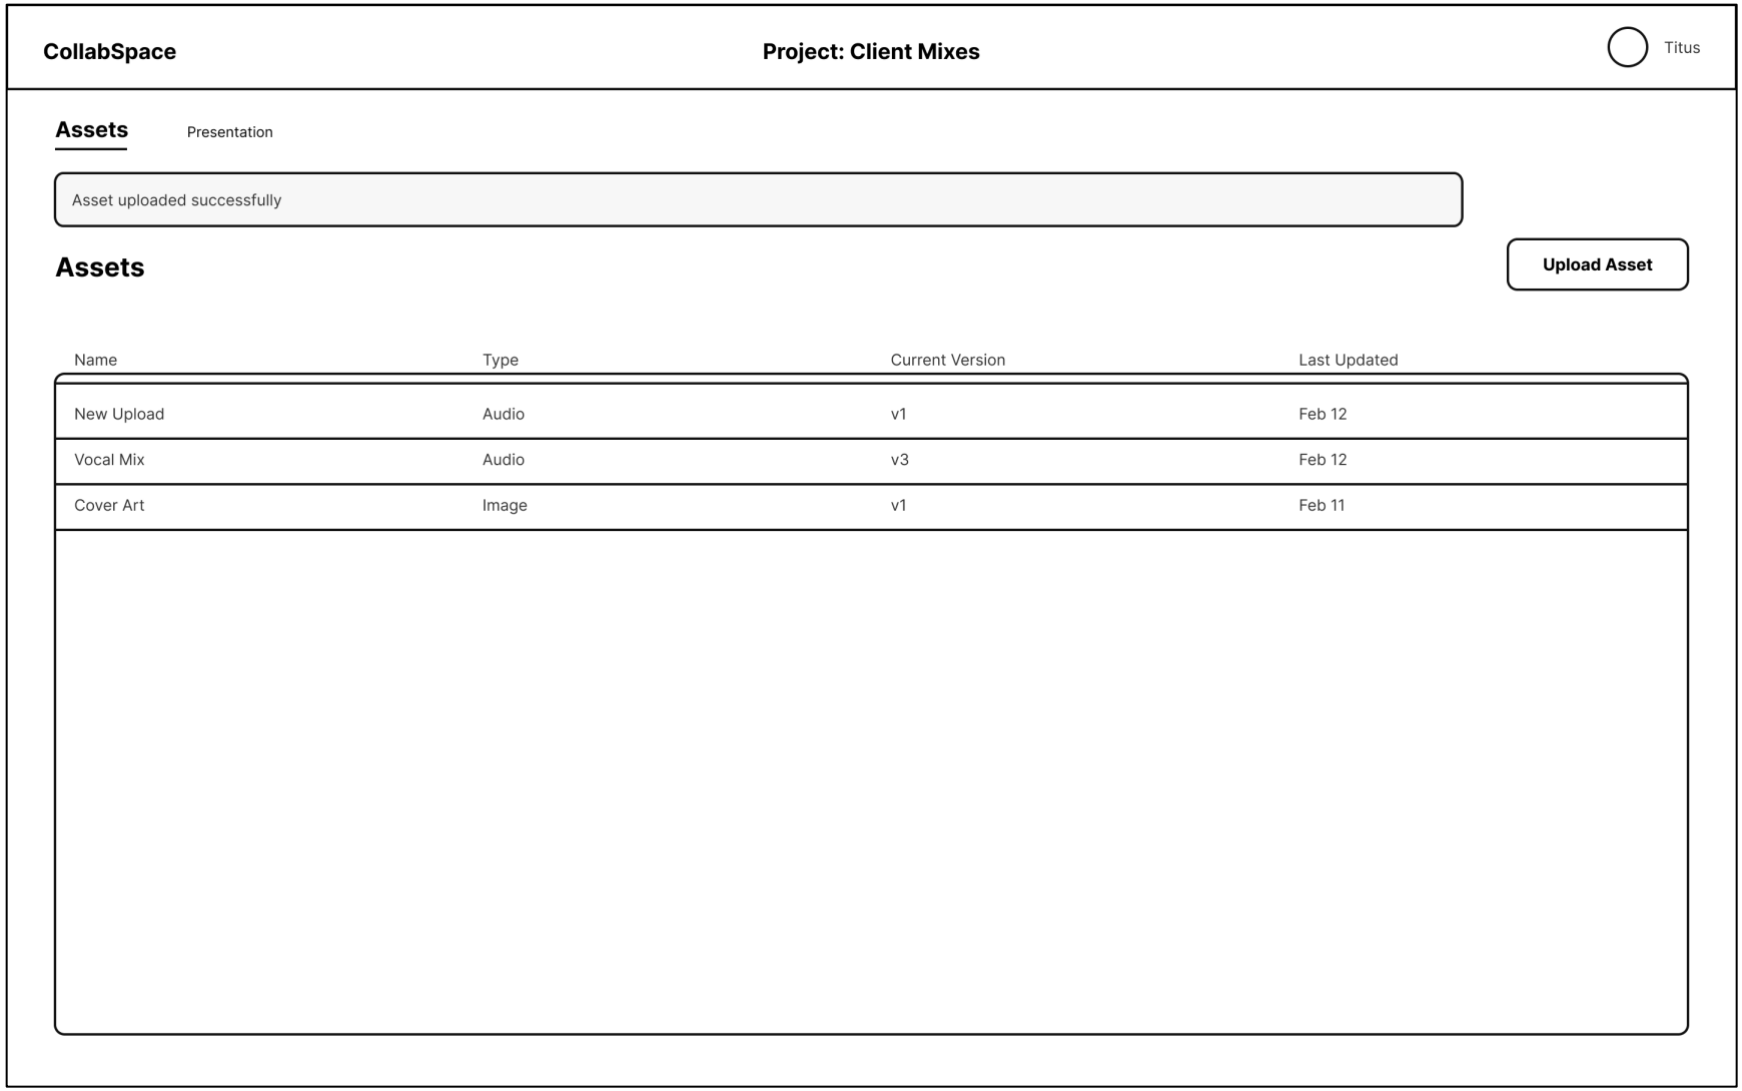
You are now in the **Project window** display. Here you can see assets for the project and upload assets to the project.

Use Case 2 – Upload Asset



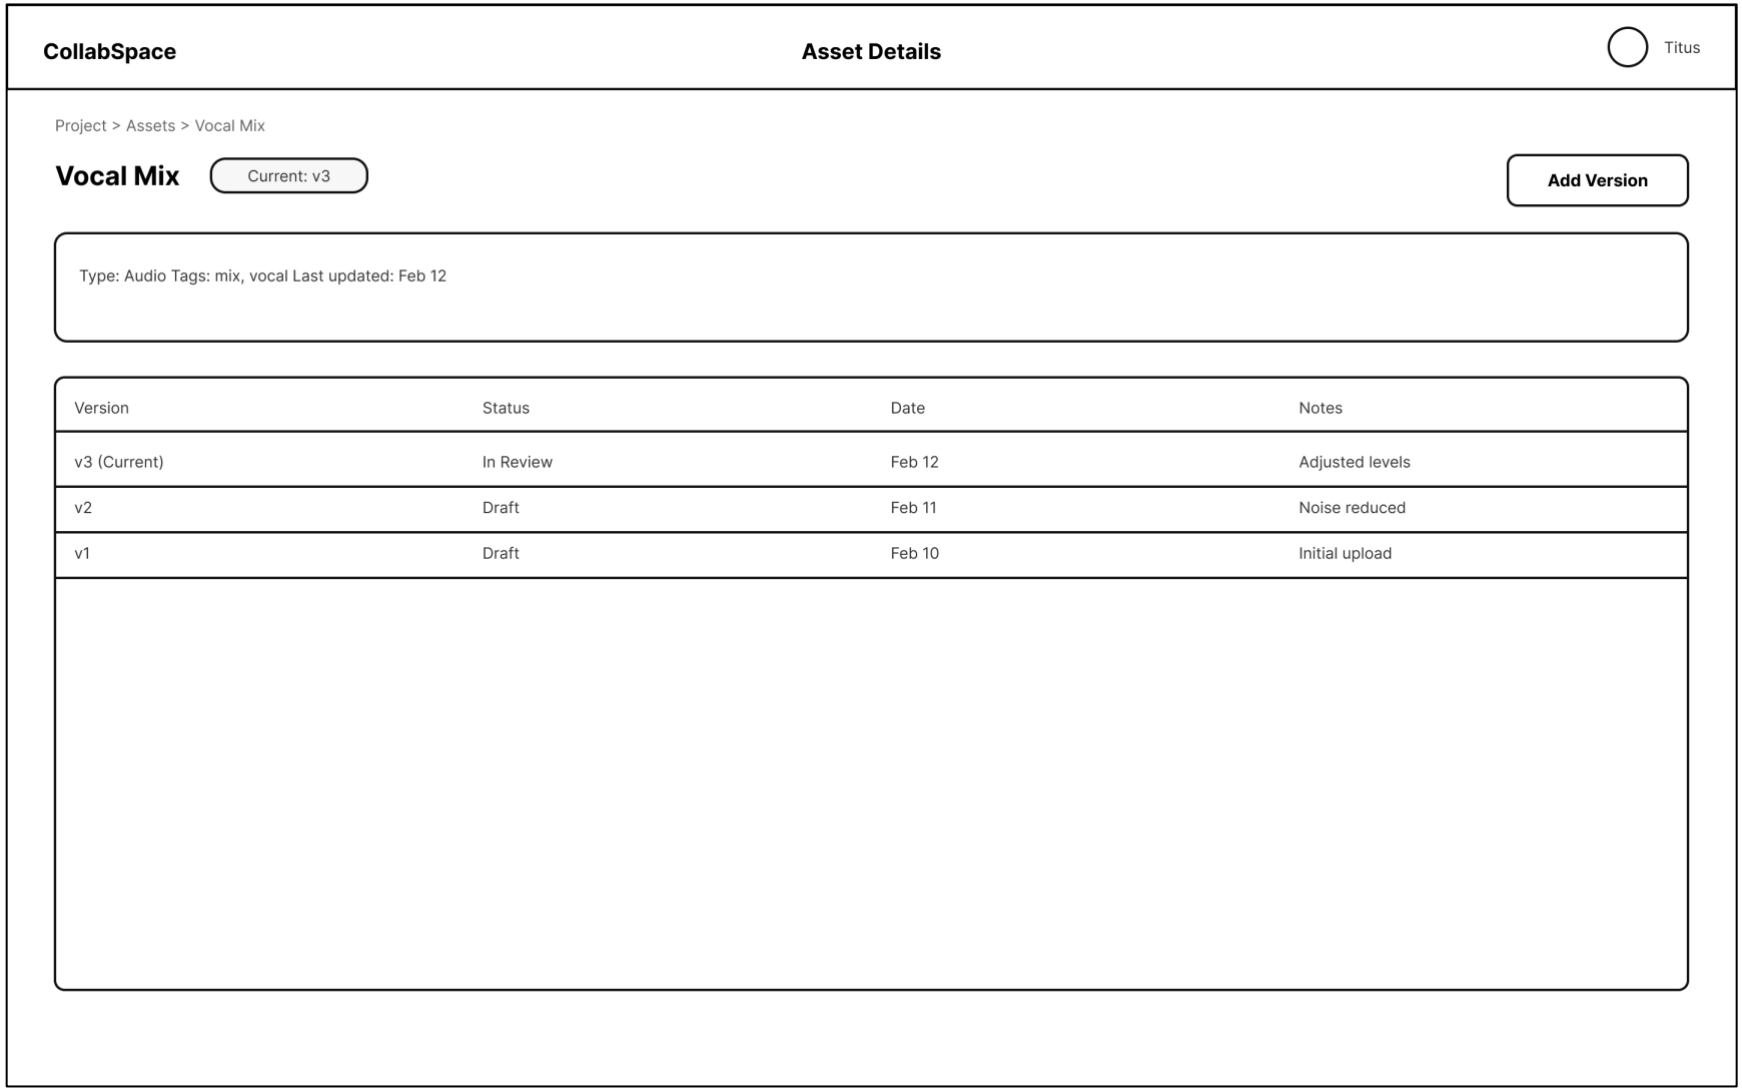
Starting in the project window display, click the **Upload Asset** button.

Drag the file from your file organizer or click **Choose File** to find the file you want to add to the project. Once the file is selected, the asset name will auto-generate based on the file name, but it can be changed. You can add tags and notes, then click **Upload**.

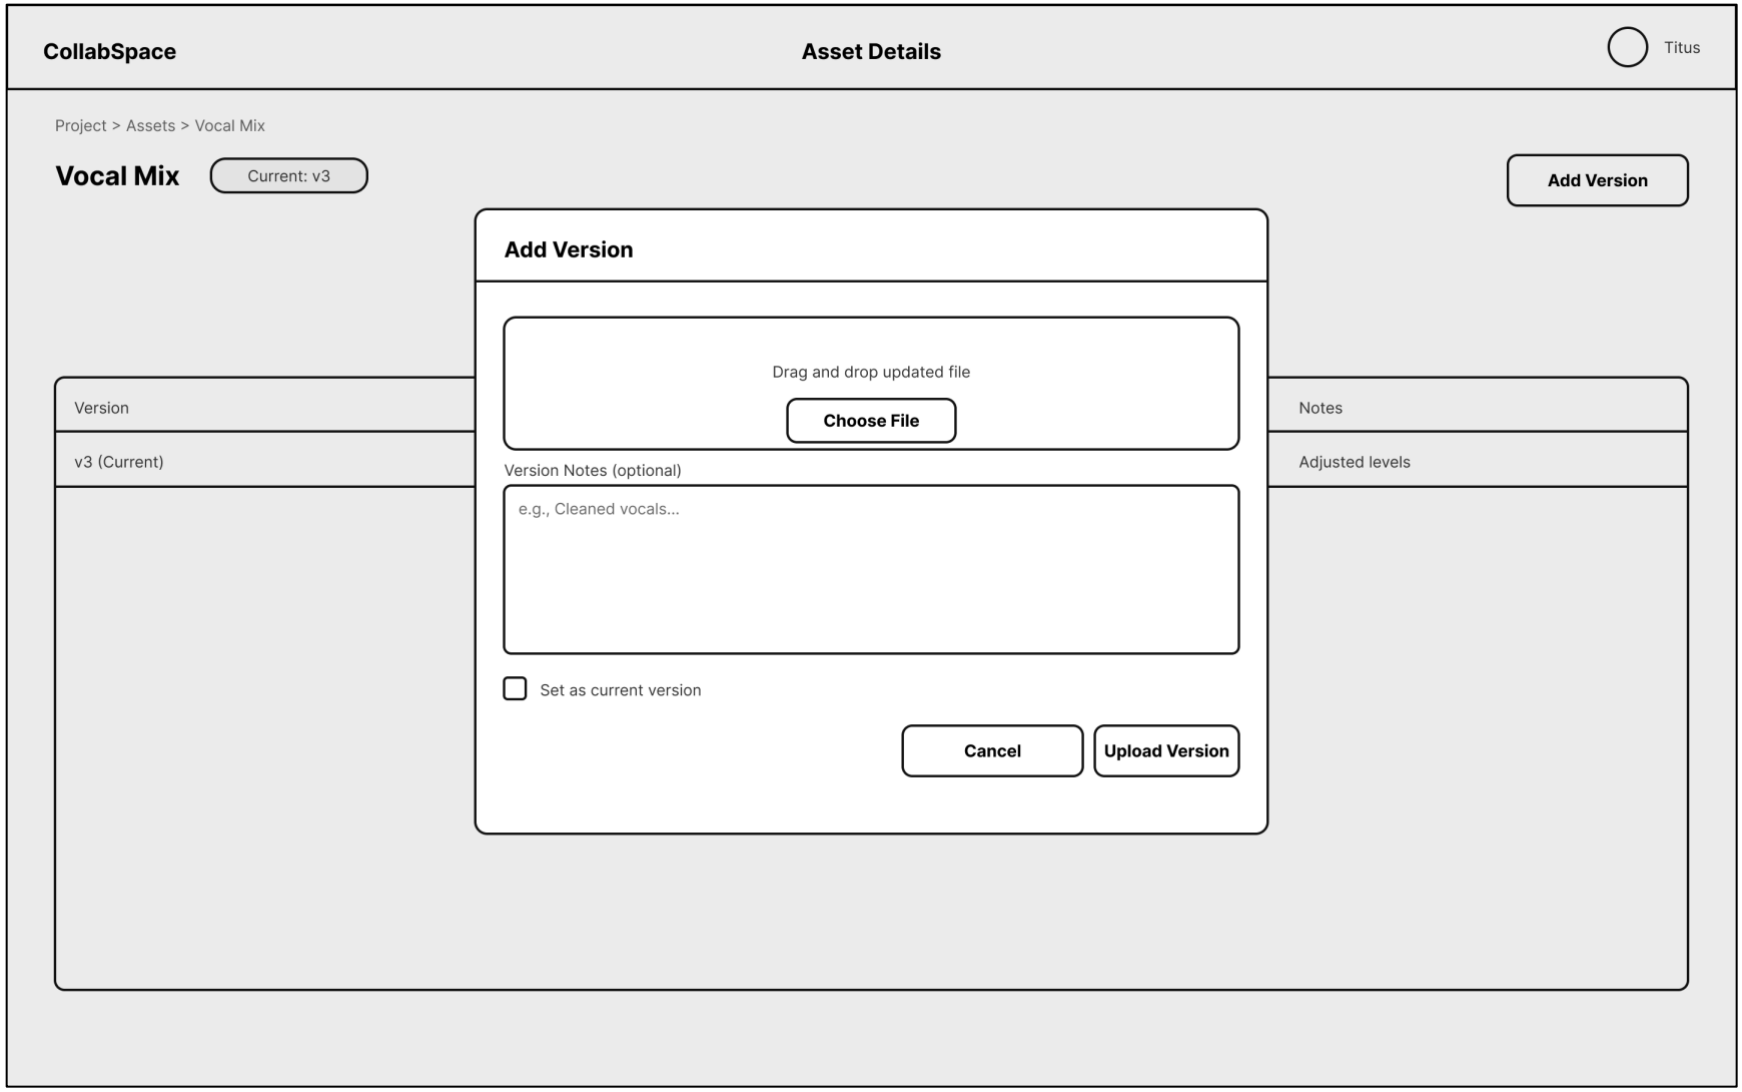


Now, that new file should be in the list of assets for the project. There is a pop-up notification letting you know **Asset uploaded successfully**.

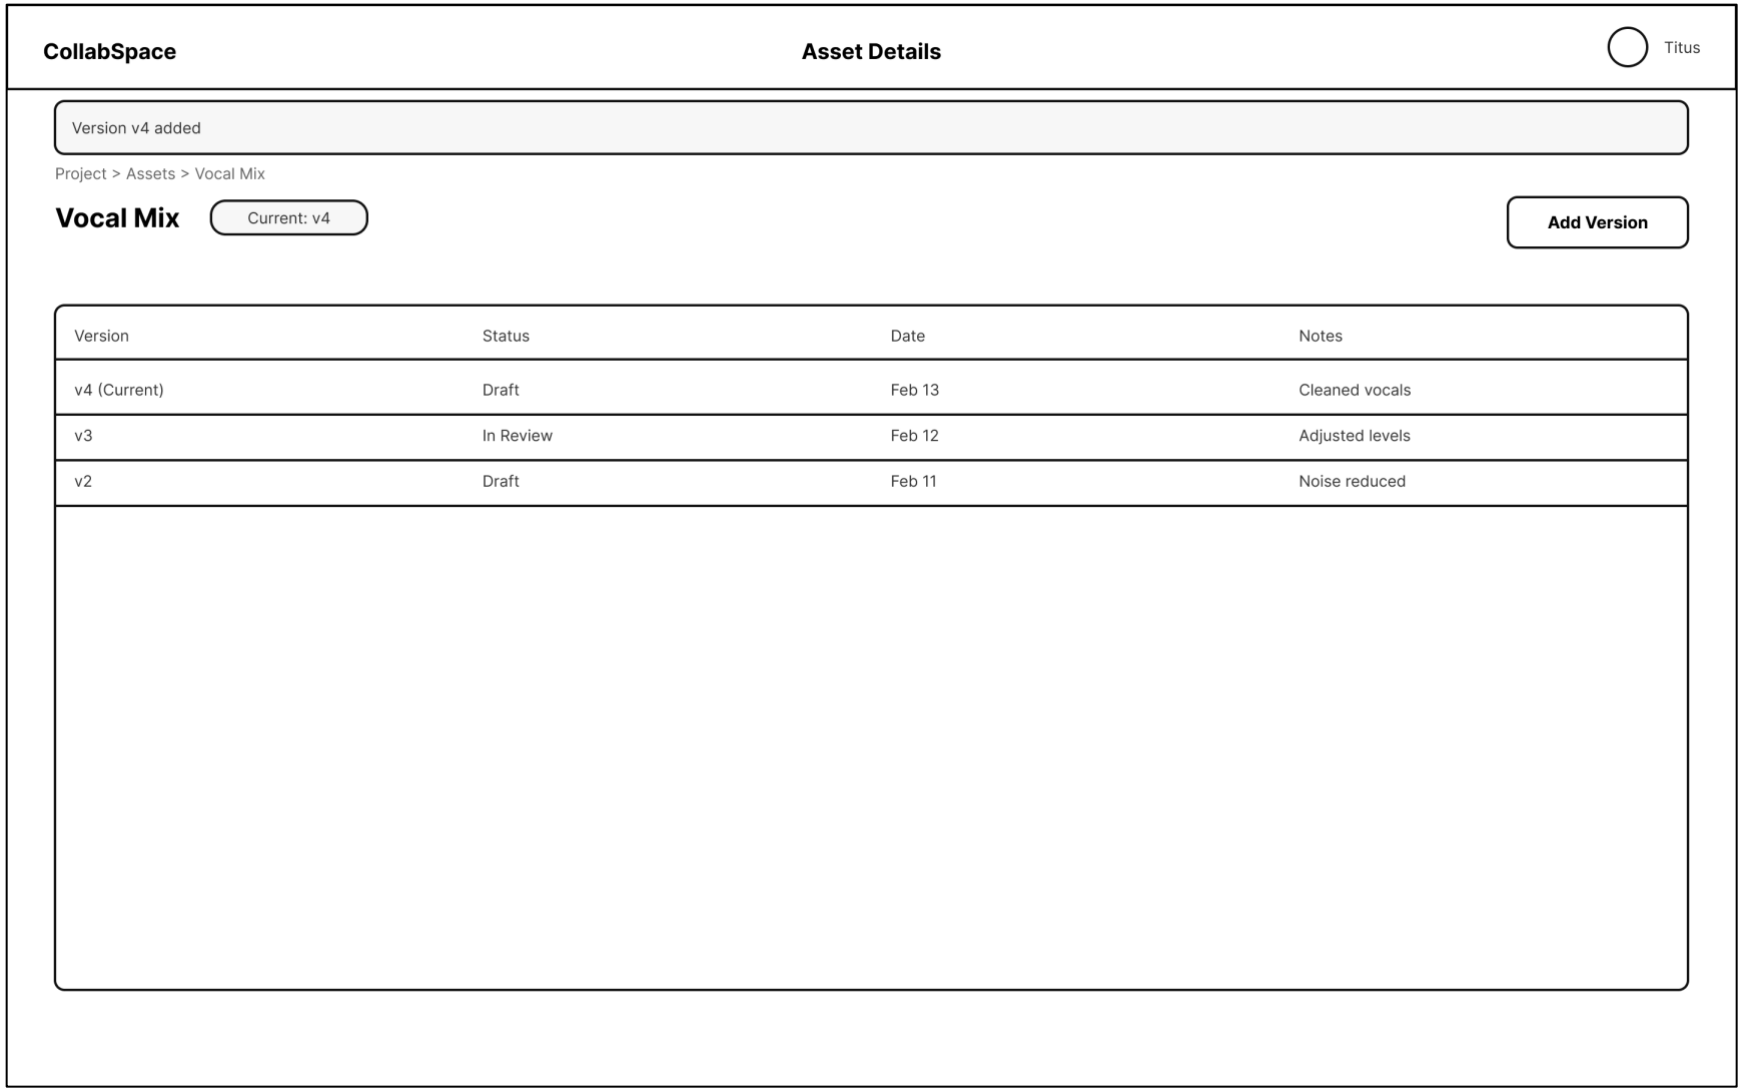
Use Case 3 – Add Version



This begins after an asset is selected from the Project Window display (see previous screen). From here, click **Add Version**.

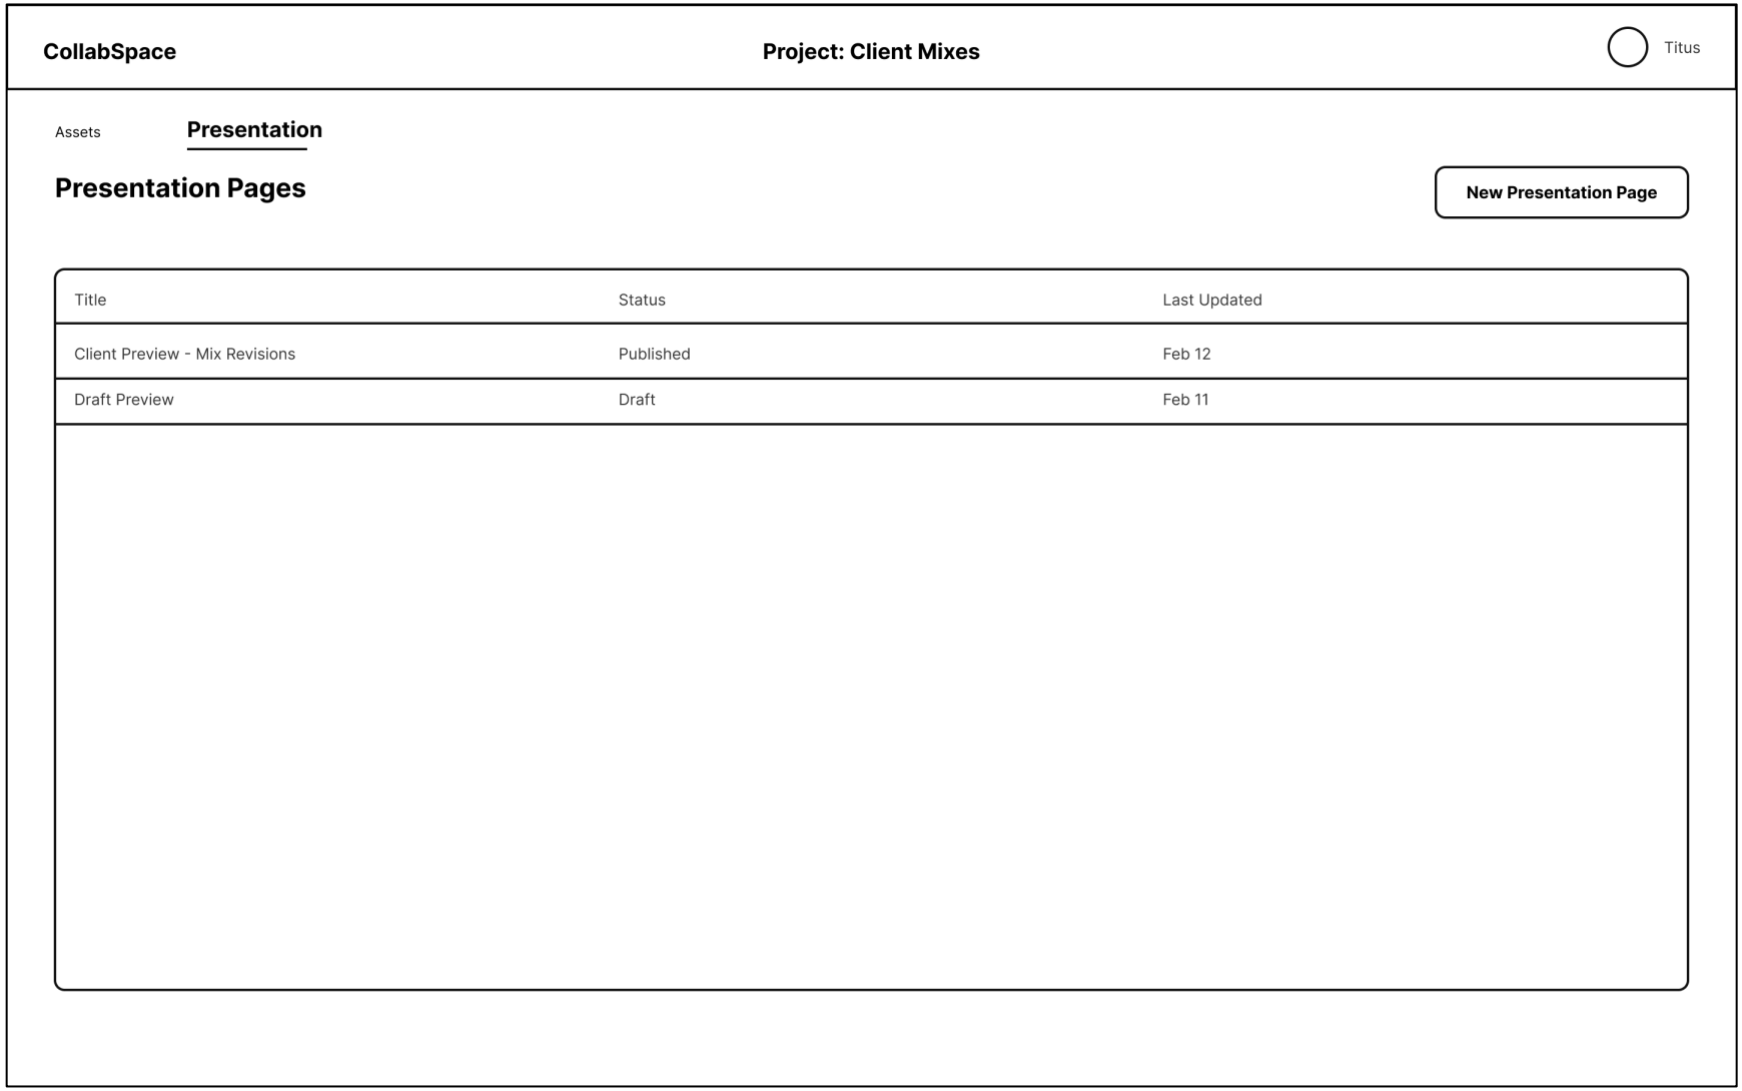


Much like uploading an asset, to add a new version of an asset you can **Drag** the file from your file organizer or click **Choose File** to find the version you want to add. You can then add version notes explaining what was changed, then click **Upload Version**.

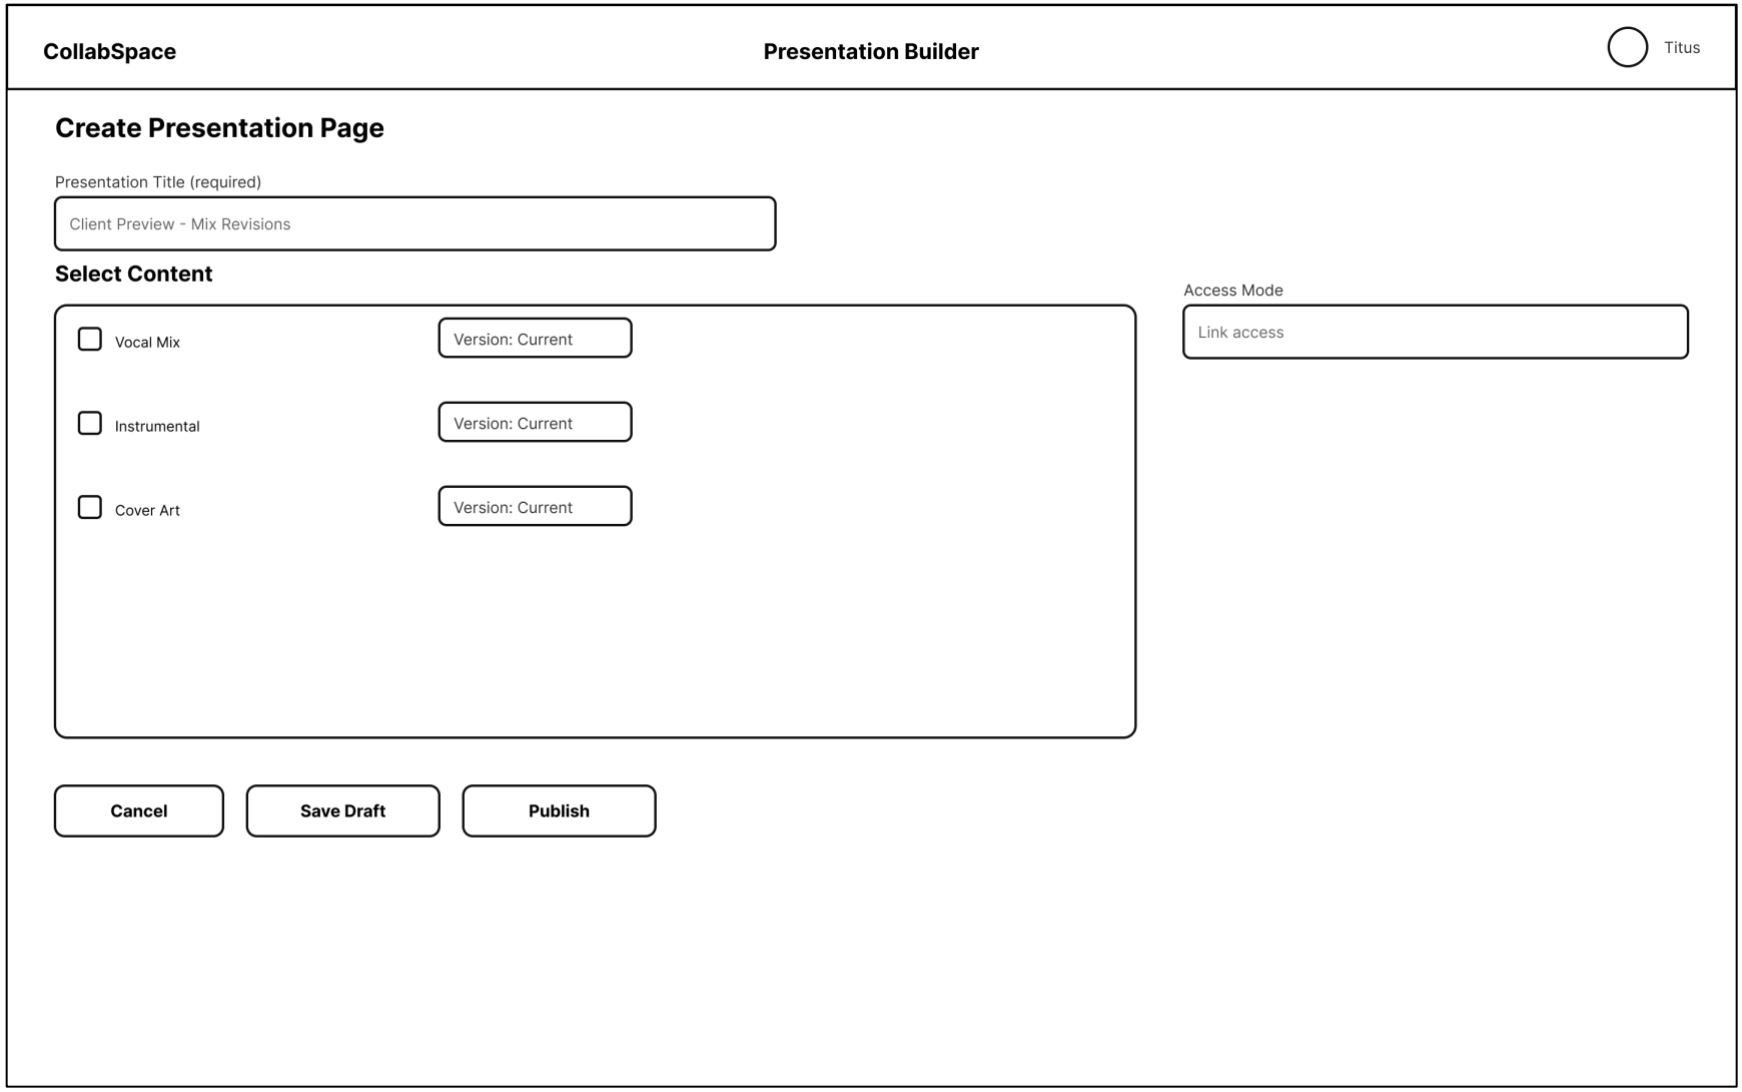


The new version is now identified with **'(Current)'** beside the version name, with a status, upload date, and notes for clarity. There is also a notification bar, also to show the action that recently took place.

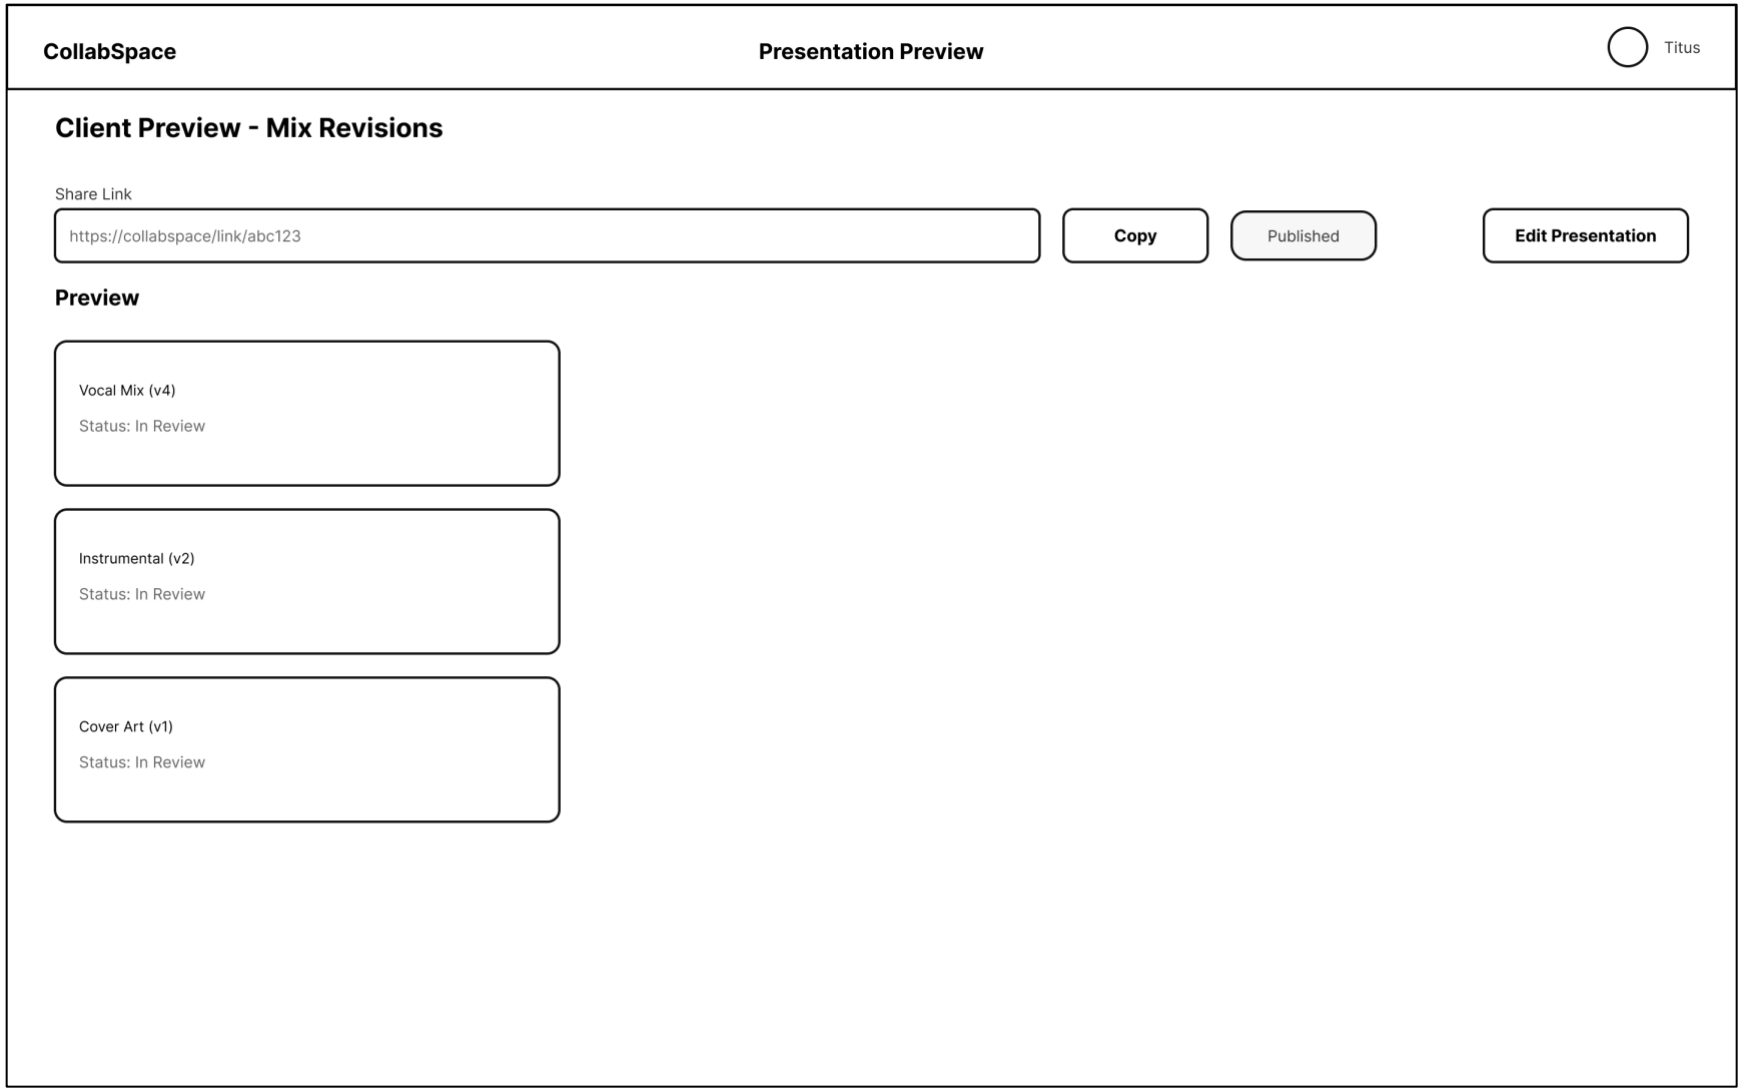
Use Case 4 – Create Presentation



Starting in the project window display, but this time in **Presentation**. To create a presentation, click **New Presentation Page.**

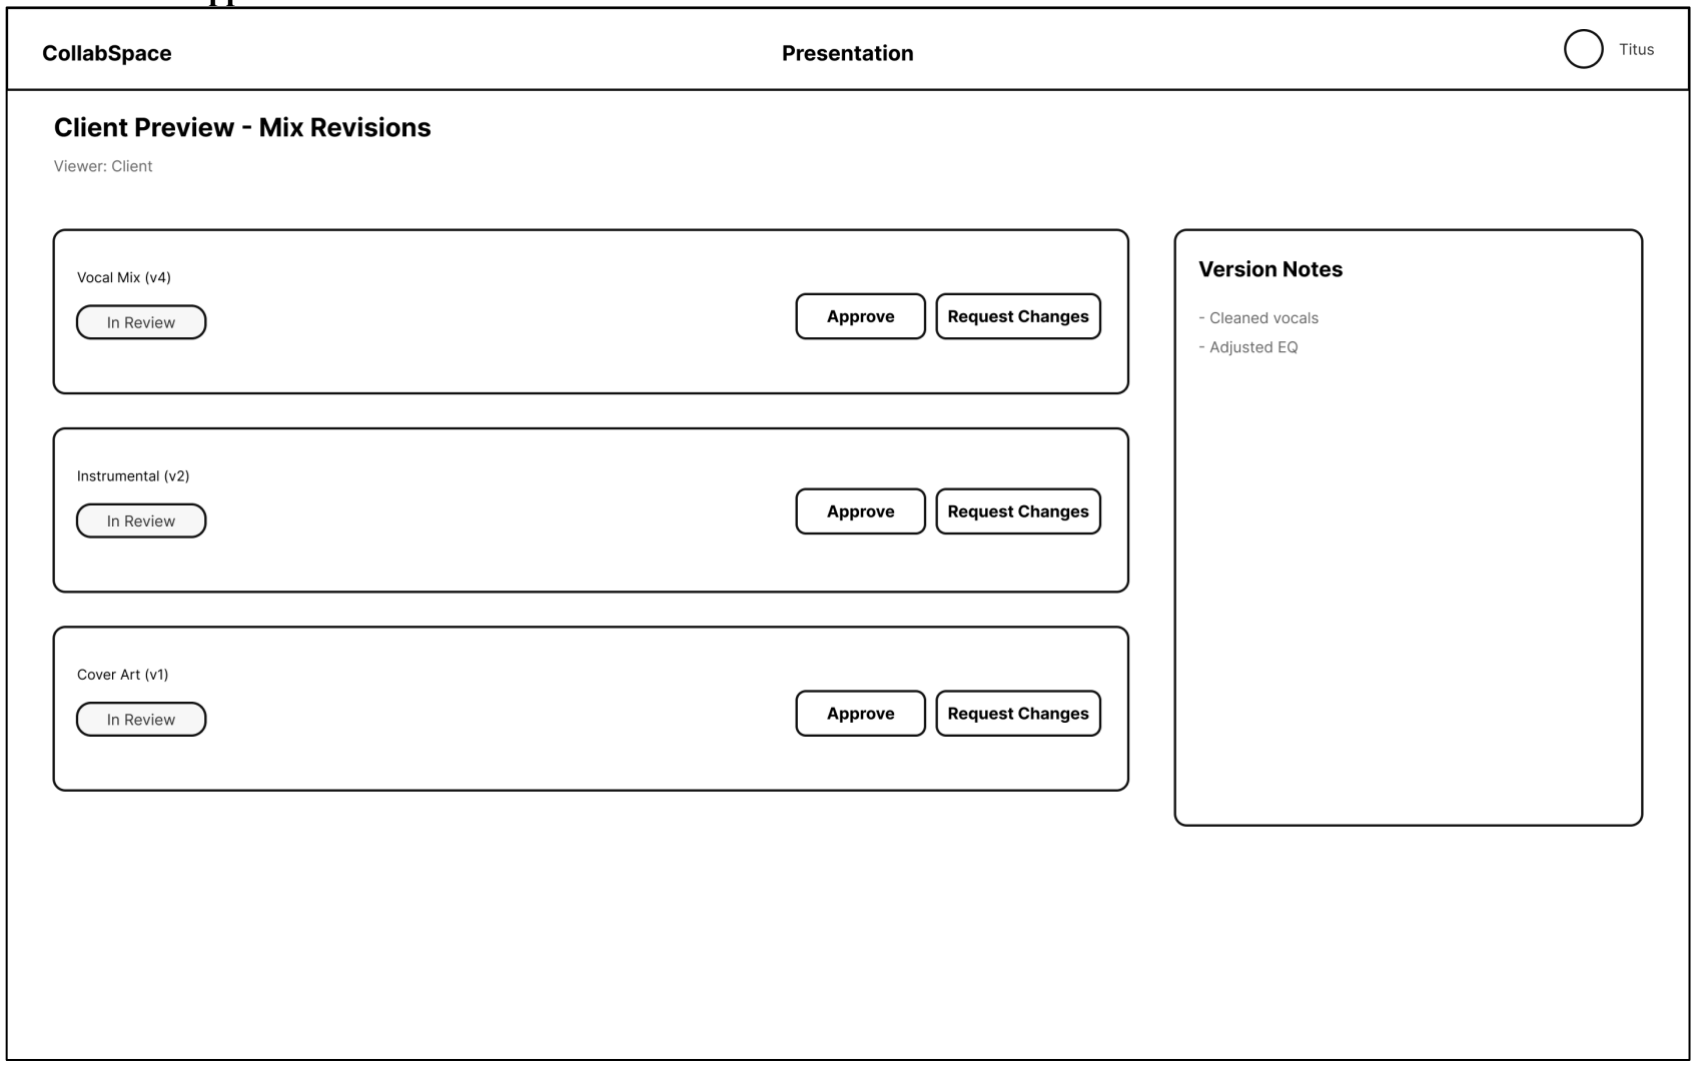


Type your **Presentation Title**, **select** the content you want to add to the presentation page, and determine how you want this presentation to be accessed in **Access Mode**. From there, you can click **Save Draft** or **Publish** to move on. In the example we will click **Publish**.

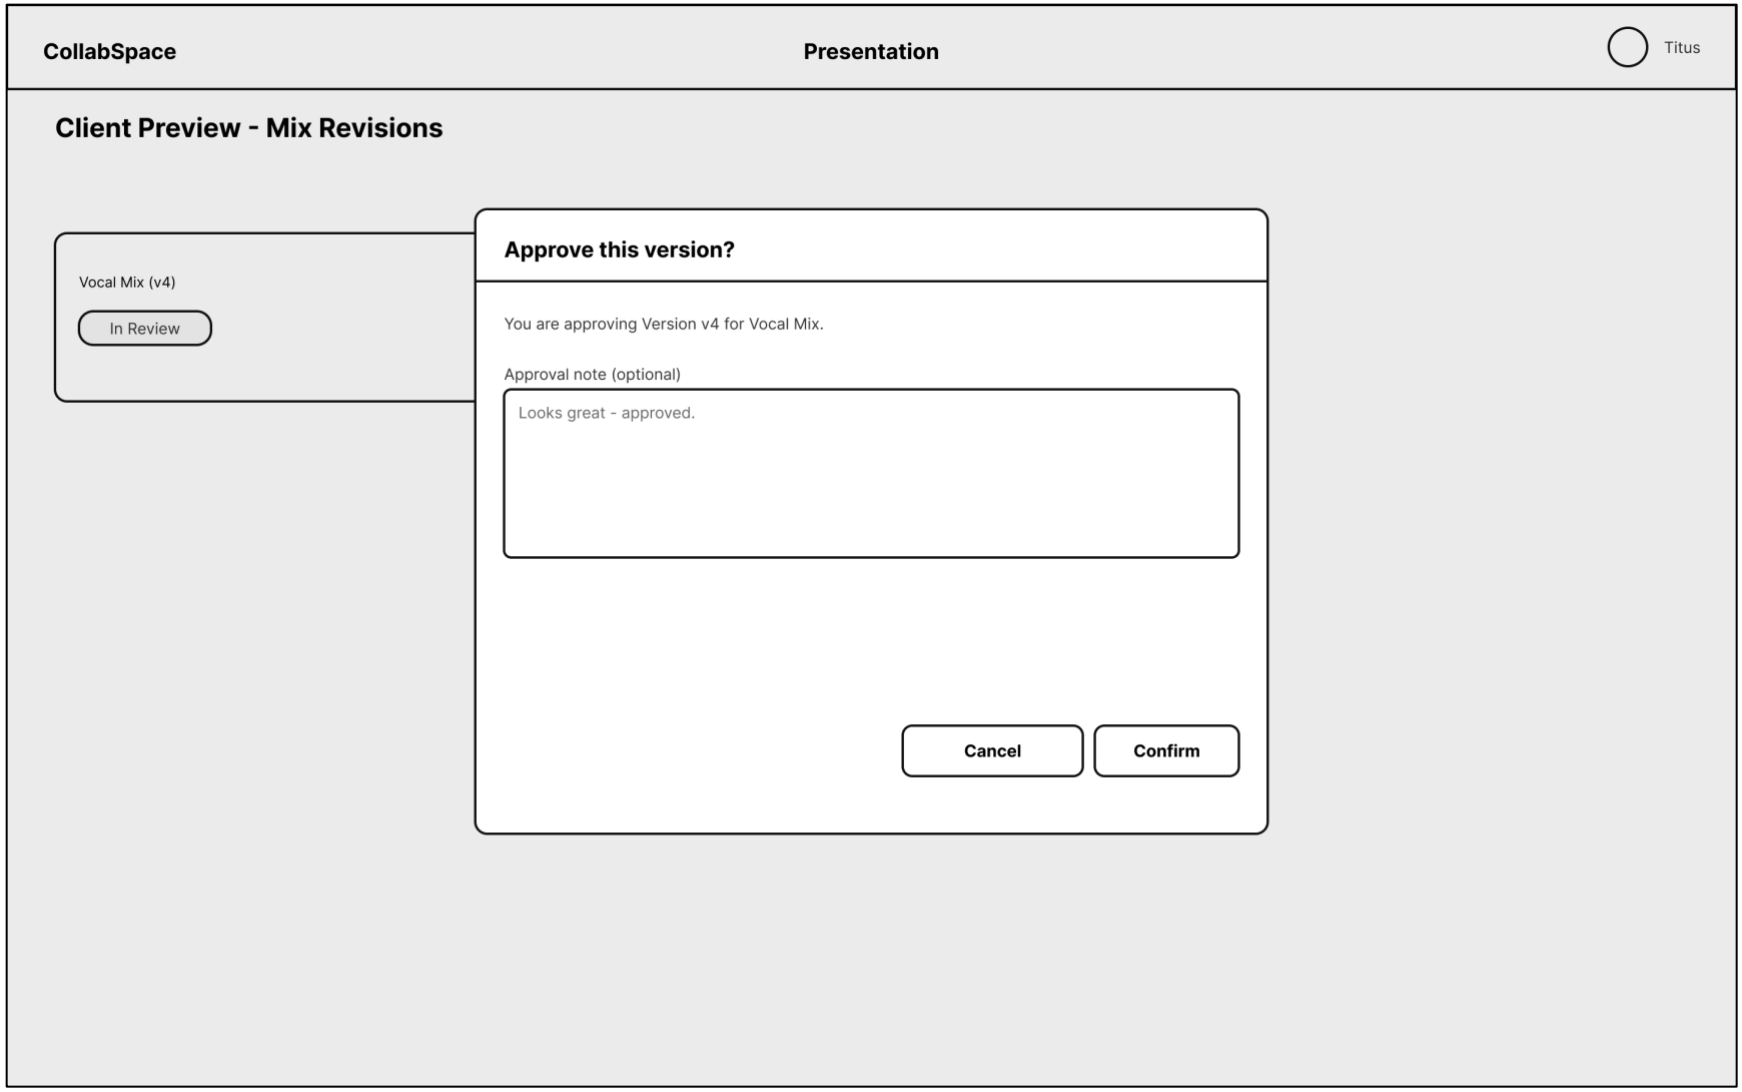


Once published, there will be a **link** for sharing and a preview with access to all the content. There is an option to **edit presentation** once published. In the top, you can see that the title for this presentation is **Mix Revisions**.

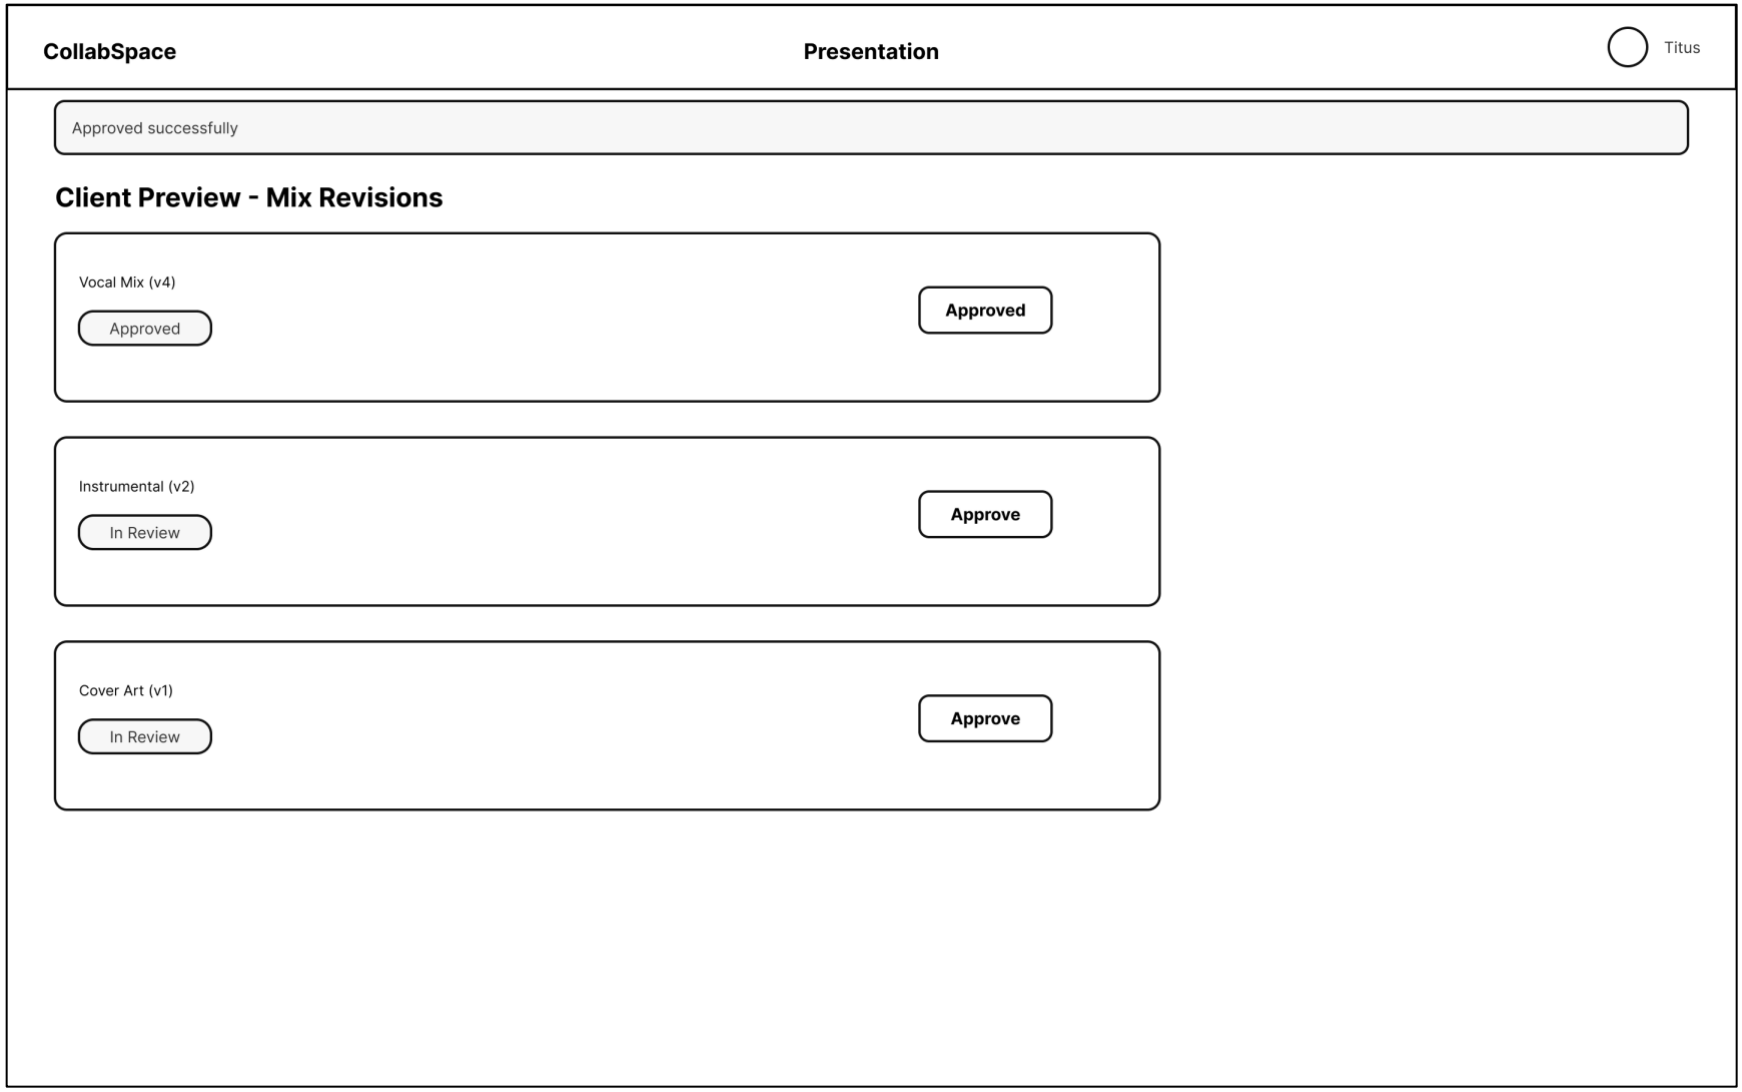
Use Case 5 – Approve Version



This begins after the project presentation link is accessed. Here we are in the Client Preview again for Mix Revisions. The client can select the content for review and either **approve** an asset or **request changes** to be made. Select **Approve**.



This popup window acts as an alert, letting you know that you are about to approve the new version for Vocal mix. The client can leave a note for the project team and either confirm or cancel. Select **Confirm** to Approve this version.



Here we can see in the top section a popup notification that says **Approved successfully**. The Vocal mix (v4) now says Approved while the other assets are still in review.

Use Effort Estimation:

Scenario	Navigation Path (what the user clicks through)	Mouse Clicks	Keystrokes
Use Case 1 Create Project	Dashboard → New Project → Enter Title/Description → Create → Project Workspace opens	4	**<40**
Use Case 2 Upload Asset	Project Workspace (Assets) → Upload Asset → Choose File → Enter Tags/Notes → Upload → Asset appears in list	5	**<40**
Use Case 3 Add Version	Assets List → Select Asset → Add Version → Choose File → Enter Version Notes → Upload Version → Version history updates	5	**<30**
Use Case 4 Create Presentation Page (2 assets)	Project Workspace (Presentation) → New Presentation Page → Enter Title → Select 2 Assets (Current versions) → Publish → Copy Link	7	**<30**
Use Case 5 Approve Version	Presentation View → Select Version → Approve → Enter Note → Confirm Approval → Status becomes Approved	3	**<30**
